

Text Decoration

The `text-decoration` property is used to set or remove decorations from text.

The value `text-decoration: none;` is often used to remove underlines from links:

Example

```
a {  
    text-decoration: none;  
}
```

The other `text-decoration` values are used to decorate text:

Example

```
h1 {  
    text-decoration: overline;  
}  
  
h2 {  
    text-decoration: line-through;  
}  
  
h3 {  
    text-decoration: underline;  
}
```

Note: It is not recommended to underline text that is not a link, as this often confuses the reader.
