## Width and Height of an Element

In order to set the width and height of an element correctly in all browsers, you need to know how the box model works.

**Important:** When you set the width and height properties of an element with CSS, you just set the width and height of the **content area**. To calculate the full size of an element, you must also add padding, borders and margins.

Assume we want to style a <div> element to have a total width of 350px:

## Example

```
div {
    width: 320px;
    padding: 10px;
    border: 5px solid gray;
    margin: 0;
}

Here is the math:

320px (width)
+ 20px (left + right padding)
+ 10px (left + right border)
+ 0px (left + right margin)
= 350px
```

The total width of an element should be calculated like this:

Total element width = width + left padding + right padding + left border + right border + left margin + right margin

The total height of an element should be calculated like this:

Total element height = height + top padding + bottom padding + top border + bottom border + top margin + bottom margin

**Note for old IE:** Internet Explorer 8 and earlier versions, include padding and border in the width property. To fix this problem, add a <!DOCTYPE html> to the HTML page.
